

iM STAKENOMICS

The Stakenomics for iM network are simple by design. We believe this ensures maximum efficiency and that even the most casual investor will fully comprehend our Stakenomics. The decision to stake iM token will reward you with more iM at a rate of 12% APR yearly and these rewards will be deployed on a daily basis. We offer this return as an incentive to assist in the decentralized securitization of the iM network.

Liquidity gives you the ability to convert assets quickly and efficiently on an exchange, for example. An individual or an institution can provide liquidity to an exchange, whether centralized or decentralized. Providing liquidity is also seen as a way to mitigate risk within market volatility. If you provide liquidity, you are a liquidity provider. Traditionally, Institutions had the opportunity to be liquidity providers for the financial markets.

Decentralized Exchanges (DEX) have opened up the liquidity provider role to a wider range of investors. You provide liquidity to a pair of tokens to allow active trading on an exchange. You can provide liquidity for most tokens and their respective base. For example, you can provide liquidity to the iM/ETH liquidity pool. iM is the token and ETH is the base you use to purchase iM. Vice versa, when you sell iM you would then receive ETH.

Buying and selling creates trading/transaction fees. Liquidity Providers are due a portion of these fees. This is among one of the revenue rewards for providing liquidity. Liquidity providers can be sheltered from volatile market swings due to the work of the Automatic Market Maker (AMM). The AMM ensures each trading pool (such as iM/ETH) is balanced 50/50 to ensure your ability to buy and sell iM tokens.
